github

完成工作

- 一维状态量的KF仿真
- 二维状态量的EKF仿真
- 应用EKF实现2D-SLAM

一维状态量的KF仿真

Edit

系统建模:

```
x+ = F_x *x + F_u * u + F_n * n

y = H * x + v

其中:

F_x = 1;

F_u = 1;

F_n = 1;

u = 1:

H = 0.5;

Q = 1;

R = 1;
```

状态先验:

```
x = 0;
P = 1e4;
```

仿真初值:

```
X = 7;
```

仿真结果:

二维状态量的EKF仿真

系统模型:

```
x+ = f ( x, u, n )
y = h ( x ) + v
```

系统定义:

```
x = [px py vx vy]'
y = [d, a]'
u = [ax, ay]'
n = [nx, ny]'
v = [vd, va]'
px+ = px + vx*dt
```

```
py+ = py + vy*dt
vx+ = vx + ax*dt + nx
vy+ = vy + ay*dt + ny

d = sqrt(px^2 + py^2) + vd
a = atan2(py, px) + va

Q = diag([.1 0.1].^2)
R = diag([.1 1*pi/180].^2)
```

状态先验:

```
x = [1 1 0 0]'
P = diag([1 1 1 1].^2)
```

仿真初值:

```
X = [2 1 -1 1]'
```

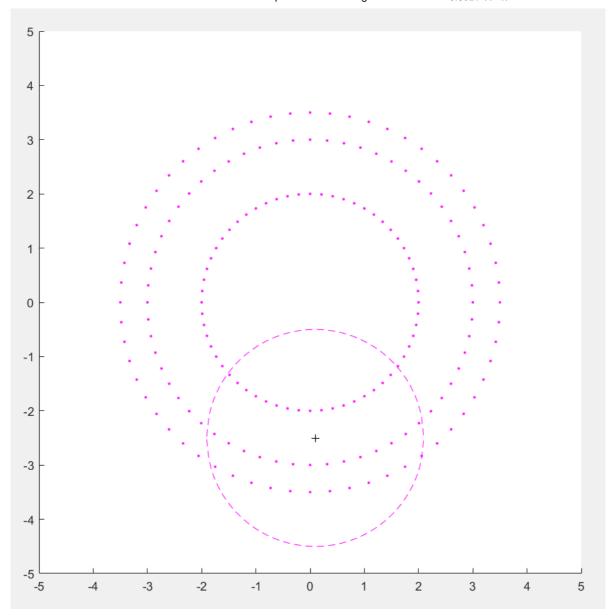

仿真结果:

应用EKF实现2D-SLAM

问题定义

某移动机器人按照给定的运动方程在一个环境中运动,并且环境中有n个固定点;这个机器人身上装有某种传感器,一定范围内该种传感器能够量测到某些固定点到自己的距离与角度,现在要根据运动方程和量测信息估算机器人的位置和n个固定点的位置。

EKF-SLAM步骤

• 运动更新

运动更新时,固定点坐标不变,所以只需要根据运动方程更新(x,y,a)及其协方差与互协方差即可。

• 观测到曾经观测过的固定点

这时候依次对观测到的特征点信息进行EKF更新

Landmark observations are processed in the EKF usually one-by-one

• 观测到新的固定点

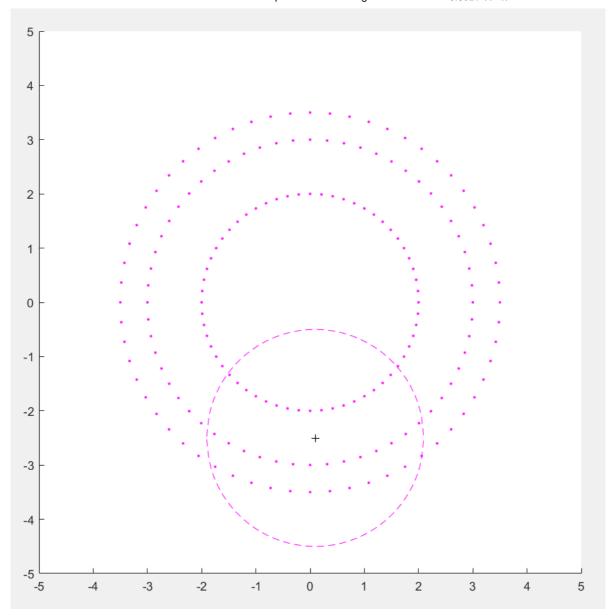

这时候观测到新的固定点,需要进行状态增广。根据逆观测方程,使用观测信息推测出新加的增广状态均值与方差,然后加入 到总体的状态与协方差矩阵中。

Matlab代码

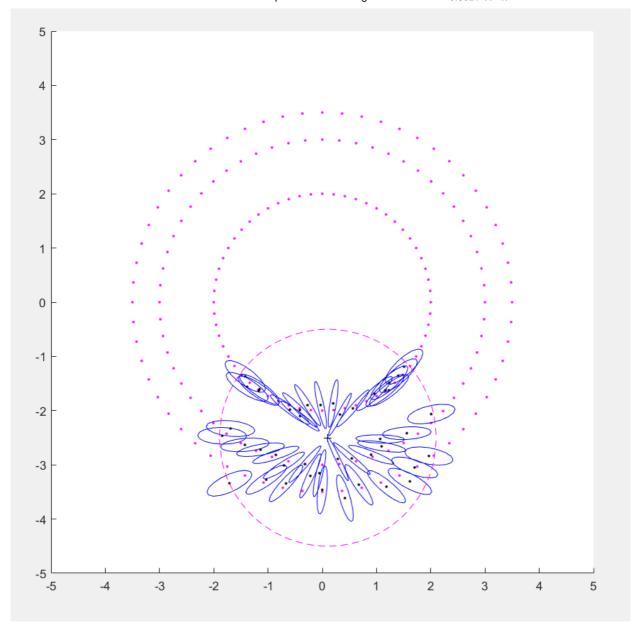

主文件为slam.m,运行即可。

结果展示

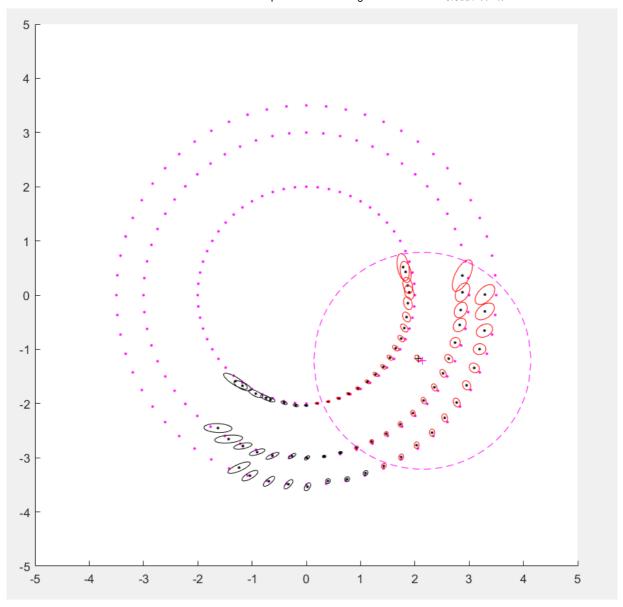

• 传感器探测范围与路标点

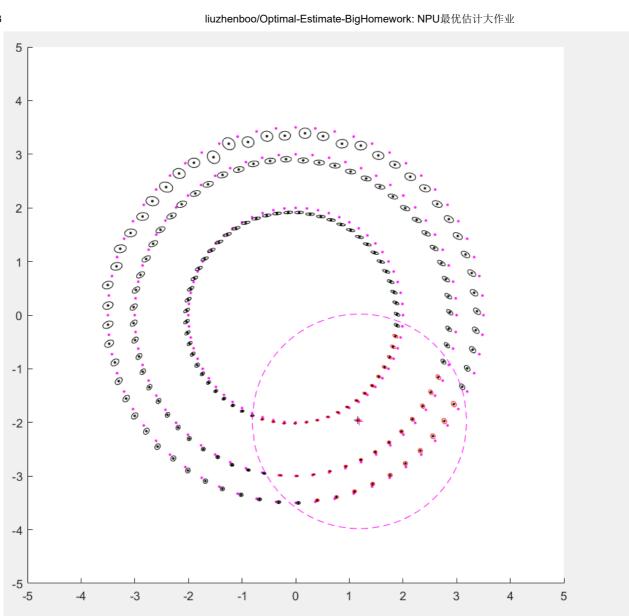

• 第一次状态增广

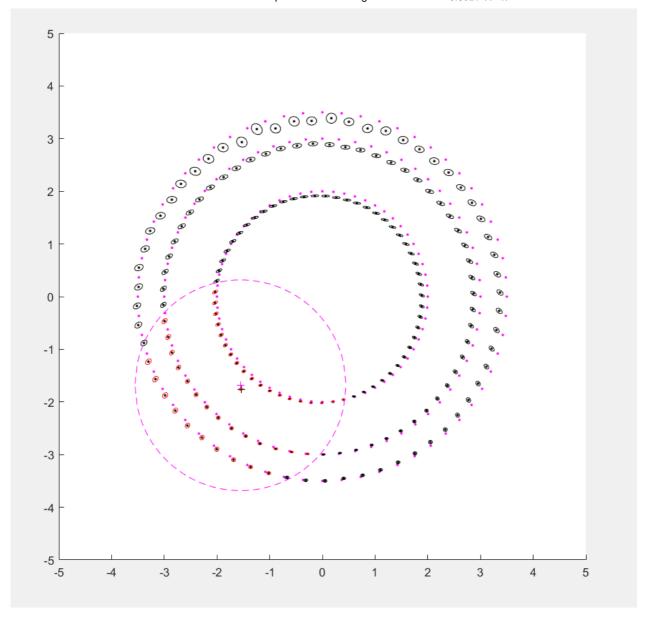

• 状态持续扩大

• 状态增广已停止

改动

2020/2/21增加了轨迹显示
